EDUCATION

University of Toronto

Expected May 2027

HBSc. Statistics Specialist, Economics Major, Mathematics Minor

Toronto, Ontario

- **Relevant courses:** Statistical Methods for Machine Learning, Regression Analysis, Time Series Analysis, Probability Theory, Bayesian Statistics, Econometrics, Multivariate Data, Financial Economics, Corporate Finance, Differential Equations, Stochastic Processes, Real Analysis, Mathematical Theory of Finance

PROFESSIONAL CERTIFICATIONS

CFA (Chartered Financial Analyst)

Toronto, Ontario

Level I Candidate (November 2026)

January 2026 - Present

TECHNICAL SKILLS

Languages: Python, Java, SQL, STATA, R Studio, Excel VBA

Libraries: Pandas, Numpy, Sci-kit Learn, TensorFlow, Keras, SQLite, statsmodel, seaborn, Matplotlib, Plotly

Tools & Technologies: SaaS, Google Cloud Platform, Azure, VS Code, Jupyter Notebook, Power BI, Tableau, Teradata, EDL, EDW, AI Farm, Microsoft Office (Excel, Word, PowerPoint)

EXPERIENCE

Data Analyst - Cards Analytics & Insights

Sept. 2026 – Present

Royal Bank of Canada

Toronto, ON

- Use **SQL** in **Teradata** to extract and join cards and account-level data - credit (Visa/Mastercard), debit, and core banking records - supporting analytics for Personal Banking
- Develop Power BI dashboards on cards portfolio metrics for management, reducing reliance on ad hoc data pulls
- Scoping an independent analytics project modelling account state transitions as a Markov chain to characterize customer movement between [e.g. Revolver, Transactor, Dormant] states

Research Assistant - Climate Statistics

June 2026 – Present

University of Toronto - Advised by [PHD Candidate - Ian Zhang](#)

Toronto, ON

- Built a semivariogram-regularized U-Net for temperature downscaling in PyTorch (custom differentiable variogram estimator, 0.99 correlation to the GSTools reference), trained across 9 regularization strengths on 200 simulated fields and 1,096 daily reanalysis fields.
- Characterized the structure-vs-accuracy tradeoff quantitatively: swept regularization strength and measured pointwise ($R^2 = 0.94-0.97$) against spatial-structure (variogram) error, showing pixel-wise metrics alone miss spatial fidelity, motivating a structure-aware selection criterion
- Engineered a real-data pipeline ingesting Canadian Surface Reanalysis (CaSR v3.2, 10 km) via OPeNDAP, producing 1,096 model-ready daily temperature fields with leak-free time-block train/test splits

Risk Consultant Intern

May 2022 - August 2022

KPMG

Hanoi, Vietnam

- Quantified valuation-related risks by calculating asset over/understatements from price/quantity discrepancies and translating impact into NAV basis points (bps) for risk management
- Analyzed large datasets using Excel VBA to streamline data processing, enabling faster detection of risks and improving report accuracy, reducing processing time by **30%**

PROJECTS

Forecasting Dow Jones Excess Return

python | pandas | statsmodel | ARIMA | yfinance

- Analyzed Dow Jones excess returns using Python, applying **stationarity testing (ADF)** and **ARMA modeling** to financial time-series data
- Selected an **ARMA(2,2)** model via systematic **AIC grid search** and validated fit using Ljung-Box and heteroskedasticity diagnostics, confirming white-noise residuals
- Produced **predictive models using 2-step-ahead forecasts** for Nov-Dec 2025 with **95% prediction intervals ($\pm 8\%$)**, capturing realized returns within bounds
- Compared predicted vs. actual excess returns, reporting **forecast errors of 0.22 percentage points**
